Let $\mathrm{G}=(\mathrm{V}, \mathrm{E})$ be a simple connected graph. Let $\mathrm{e}=\mathrm{uv} \in \mathrm{E}(\mathrm{G})$ and $m_{u}(e)$ be the number of edges closer to $u$ than vand $m_{v}(e)$ be the number of edges closer to $v$ than $u$. Then the $\operatorname{PI}(\mathrm{G}, \mathrm{x})$ of the graph G is defined as $\operatorname{PI}(G)=\sum_{e=u v} x^{m_{u}(e)+m_{v}(e)}$. We compute the PI vertex PI polynomial of this dendrimer.

Keywords: PI Index, PI Polynomial, Dendrimer

## 1. Introduction

Let $G$ be a simple connected graph. We denote the vertex set and the edge set of a graph $G$ by $V(G)$ and $E(G)$, respectively. For notation and graph theory terminology not presented here, we follow [1-7].

Let G be a graph and P is a property on G . A counting polynomial for G is a polynomial as $\mathrm{P}(\mathrm{G}, \mathrm{x})=\sum_{\mathrm{k}} \mathrm{P}(\mathrm{G}, \mathrm{k}) \mathrm{x}^{\mathrm{k}}$, where $\mathrm{P}(\mathrm{G}, \mathrm{k})$ is the frequency of occurrence of the property P of length k and x is simply a parameter to hold k [3].

A topological index of a graph is a number related to a graph which is invariant under graph automorphisms. It is easy to see that every topological index defines a counting polynomial and vice versa. The simplest topological indices are the number of vertices and edges of the graph. The Wiener index $(\mathrm{W})$ is the oldest topological indices $[12,13]$.

Let $G$ be a simple graph. The $\operatorname{PI}(G)$ defined as $P I(G)=\sum_{e=u v} m_{u}+m_{v}$. Where $m_{\mathrm{u}}(\mathrm{e})$ is the number of edges closer to $u$ than $v$ and $m_{v}(e)$ is the number of edges closer to $v$ than $u[8]$. The PI polynomial of $G$ defined as $P I(G, x)=\sum_{e=u v} x^{m_{u}(e)+m_{v}(e)}$. It is clear that the derivation of $\operatorname{PI}(G, x)$ for $x=1$ is $\operatorname{PI}(G)$.

The $\mathrm{PI}_{\mathrm{v}}(\mathrm{G})$ defined as $P I_{v}(G)=\sum_{e=u v} n_{u}+n_{v}$. Where $\mathrm{n}_{\mathrm{u}}(\mathrm{e})$ is the number of vertices closer to $u$ than $v$ and $n_{v}(e)$ is the number of vertices closer to $v$ than $u$. The $P_{v}$ polynomial of $G$ defined as $P I_{v}(G, x)=\sum_{e=u v} x^{n_{u}(e)+n_{v}(e)}$. It is clear that the derivation of $\mathrm{PI}_{v}(\mathrm{G}, \mathrm{x})$ for $\mathrm{x}=1$ is $\mathrm{PI}_{\mathrm{v}}(\mathrm{G})[8-13]$. Throughout this paper our notation is standard and taken mainly from the standard book of graph theory and $[14,15]$. We present some theorems that we need in this paper.

[^0]Theorem A[12]. $\operatorname{PI}(\mathrm{G})=|\mathrm{E}|^{2}-\sum_{e=u v} N(e)$ where $\mathrm{N}(\mathrm{e})=|\{\mathrm{xy} \mid \mathrm{d}(\mathrm{x}, \mathrm{e})=\mathrm{d}(\mathrm{y}, \mathrm{e})\}|$.
Theorem B. $\operatorname{PI}(\mathrm{G}, \mathrm{x})=x^{|E|} \sum_{e=u v} x^{-N(e)}$.
Theorem C. $\mathrm{PI}_{v}(\mathrm{G})=|\mathrm{E}(\mathrm{G})| \cdot|\mathrm{V}(\mathrm{G})|-\sum_{e=u v} N(e)$. Where $\mathrm{N}(\mathrm{e})$ is the number of vertices of $G$ with $d(x, u)=d(x, v), x \in V(G)$.

Theorem D. $\mathrm{PI}_{\mathrm{v}}(\mathrm{G}) \leq|\mathrm{E}(\mathrm{G})| \cdot|\mathrm{V}(\mathrm{G})|$ with equality if and only if G is a bipartite graph.

## 2. Main results

In this paper, we compute the PI index and PI Polynomial of Dendrimer NS(n) where NS( n ) is the following Nano Star.

Construction of $N$-benzyl-terminated amide-based dendrimers.
Lemma. $\mid \mathrm{V}\left(\mathrm{NS}(\mathrm{n}) \mid=3.2^{\mathrm{n}+4}-8\right.$ and $\mid \mathrm{E}\left(\mathrm{NS}(\mathrm{N}) \mid=52.2^{\mathrm{n}}-8\right.$.

Theorem 1. If $G$ is the Nano star $\operatorname{NS}(n)$ then $\operatorname{PI}(\operatorname{NS}(n), x)=6.2^{n+2} x 52.2^{n}-10+\left(28.2^{n}-8\right)$ $x^{52.2^{n}-9}$ and $P I(N S(n))=\left(52.2^{n}-8\right)\left(52.2^{n}-8-1\right)-6 \times 2^{n+2}$.

Proof. Let $\mathrm{e}=\mathrm{uv}$ be an edge on hexagon then $m_{u}(e)+m_{v}(e)=m-2=52.2^{\mathrm{n}}-8-2=52.2^{\mathrm{n}}-$ 10. A simple coputation shows that if $\mathrm{e}=\mathrm{uv}$ is not an edge on hexagon then we can see that $m_{u}(e)+m_{v}(e)=m-1=52.2^{\mathrm{n}}-9$. Thus

$$
\begin{aligned}
& \operatorname{PI}(\mathrm{NS}(\mathrm{n}), \mathrm{x})=6.2^{\mathrm{n}+2} \mathrm{x}^{52.2^{n}-10}+\left(28.2^{\mathrm{n}}-8\right) \mathrm{x}^{52.2^{n}-9} \\
& \quad \operatorname{PI}(N S(n))=\left(52.2^{\mathrm{n}}-8\right)\left(52.2^{\mathrm{n}}-8-1\right)-6 \times 2^{\mathrm{n}+2} .
\end{aligned}
$$

Theorem 2. $\mathrm{PI}_{\mathrm{v}}(\mathrm{NS}(\mathrm{n}), \mathrm{x})=x^{3.2^{n+4}-8}$ and $\mathrm{PI}_{\mathrm{v}}(\mathrm{NS}(\mathrm{n}))=\left(3.2^{\mathrm{n}+4}-8\right)\left(52.2^{\mathrm{n}}-8\right)$.
Theorem 3. If $G$ be a connected graph with $k$ disjoint even $r$-cycle then $\operatorname{PI}(G)=m^{2}-m-k r$.
Proof. If e be in $\mathrm{E}(\mathrm{G})$ then $\mathrm{N}(\mathrm{e})=1$ otherwise $\mathrm{N}(\mathrm{e})=0$. By Theorem $\operatorname{API}(\mathrm{G})=\mathrm{m}^{2}-\mathrm{m}-\mathrm{kr}$.
